(Redmond, WA – February 26, 2009) - In today's climate of unprecedented economic hardship only those with the willingness to streamline operations and evolve their business through more efficient use of technology stand the chance of survival. Most businesses are taking practical, actionable steps to increase their bottom line. They're downsizing management, reducing office overhead, transitioning to remote workers, and eliminating unnecessary IT projects and expenses. And in the process, they're opening the door to reduced worker performance and loss of control over the quality of their products and services.

This is all the more reason to sit up and pay attention to this week's commercial launch of Project360°, CyberSavvy.NET's exciting new project, performance and accountability software-as-a-service (SaaS) application. Project360° provides comprehensive visibility into every aspect of knowledge worker and virtual team activity by tracking everything from attendance and project performance to communications with comments and Outlook integration. With Project360° businesses can keep running, while continuing to scale back.

CyberSavvy.NET, a Redmond-based company recognized for its excellence in on-demand data storage and management services and customizable applications, has a track record of developing solutions for industry leaders like HP, Microsoft, Lowe's and Spherion. Their Project360° application brings technology, oversight, and the ability to manage under pressure to the small-medium business market. "The greatest challenge business owners face right now is how to keep functioning in such a radical climate of change. They have to let go of key people to keep the doors open," says Amanda Hammond, Managing Partner. "Business, by nature will continue to require accountability, frontline management and communication. This can all be accomplished affordably and with excellence via the internet using our new, customizable software application."

Project360° helps businesses create order out of chaos by communicating clear job and project responsibilities; tracking activities, time and performance; and providing an open and visible work environment. Tasks and communications can be performed, collaborated on, observed, and reported on electronically. In challenging times, clarity of expectations and leadership - supported by Project360° - may just be the ticket to long term success.

Project360° is just one of several offerings from CyberSavvy.NET. The company offers a unique combination of hardware, technology, and expertise that eliminates the traditional constraints of how to scale, access, store, use and manage data and build IT systems or customized applications. Project360° is offered with state-of-the-art infrastructure, SaaS delivery, 24 x 7 customer support, and a financially backed Service Level Agreement (SLA) program.
